"Inhibition of single Shaker K channels by kappa-conoctoxin-PVIIA.";

Biophys. J. 82:3003-3011(2002).

"Inhibition of single Shaker K channels by kappa-conoctoxins bind and inhibit voltage-sensitive potassium channels. The rat brain voltage-gated potassium channels. The rat brain voltage-gated potassium channels. The rat brain voltage-gated potassium channels. The shaker (Drosophila) is sensitive. The potassium channel protein Shaker (Drosophila) is sensitive. The interaction site between the Shaker channel. In fish, this toxin is within the S5-S6 loop of the Shaker channel. In fish, this toxin catension of major fins, without immobilization or death.

"Injection of this peptide together with the delta-conocoxin pvIA causes the sudden tetanus of prey (STOP) syndrome, which is a single, lethal "fin-pop" in envenomated fish. In mice, induces

TISSUE SPECIFICITY: Expressed by the venom duct.
MASS SPECIFICITY: MM=1268.4; METHOD=FAB; RANGE=46-72; NOTE=Ref.1.
SIMILARITY: Belongs to the conotoxin O-superfamily. Kappa-type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CAUTION: Because analogs resulting of mutagenesis of Hyp-49, Asn-50, Leu-57 and Asp-59 gave very low yields upon folding, the results of mutagenesis on these residues should be interpreted with caution.

                       bonds (By similarity). Interacts with DTX1 and DTX2.

SUBCELLULAR LOCATION: Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus (By similarity).

TISSUE SPECIFICITY: In fetal tissues most abundant in spleen, brain stem and lung. Also present in most adult tissues where it is found mainly in lymphoid tissues.

PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C. terminal fragment NITM) and a N-terminal fragment NIEC). Following (TACE) to yield a membrane associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then notch-derived peptide containing the intracellular domain (NICD) in PIN: Phosphorylated (By similarity).

In DISBASE: NOTCH1 truncation is associated with T-cell acute | Numbhoblastic leukemia. ShW respeats.

SIMILARITY: Contains 5 ANK repeats.

SIMILARITY: Contains 3 Lin/Notch repeats.

SIMILARITY: Contains 3 Lin/Notch repeats.

"Interaction of Par-6 and Crumbs complexes is essential for

"Interaction of Par-6 and Crumbs complexes is essential for

photoreceptor morphogenesis in Drosophila.";

Development 130:4363-4372(2003).

-I FUNCTION: Plays a central role in cell polarity establishment.

Participates in the assembly, positioning and maintenance of
adherens junctions via its interaction with the SAC complex.

Controls the coalescence of the spots of zonula adherens (ZA) into
a adhesive ring around the cells. It may act as a signal. Involved
in morphogenesis of the photoreceptor rhabdomere, for positioning
attd growth of rhabdomere and AJ during the crucial period of
photoreceptor extension along the proximodistal axis of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (Potential).
(Potential).
(Potential).
composed of par-6, baz and aPKC, via its interaction with Patj.
Interacts with other proteins with Patj and sdt via its short
cytoplasmic teal.
-1- SUBCELLULAR LOCATION: Type I membrane protein. Specifically
localized to the apical membrane.
-1- PTM: Phosphorylated in the cytoplasmic domain (Potential).
-1- SIMILARITY: Contains 29 EGF-like domains.
-1- SIMILARITY: Contains 3 laminin G-like domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Crumbs protein.
Extracellular (Potential)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cytoplasmic (Potential)

```

domain (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus. Affects the implementation of differentiation, proliferation and apoptotic programs (By similarity). May play an essential role in postimplantation development, probably in some aspect of cell specification and/or differentiation. May be involved in mesoderm development, somite formation and neurogenesis. Involved in the

maturation of both CD4+ and CD8+ cells in the thymus. Important for follicular differentiation and possibly cell fate selection

C --- SUBCELLULAR LOCATION: Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus. Proteolytical processing NICD is translocated to the nucleus. Skeletal muscle and liver.

--- TISSUE SPECIFICITY: Expressed in the brain, heart, kidney, lung, skeletal muscle and liver.

--- THM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TW) and a N-terminal fragment N(TW) and a N-terminal fragment N(TW) and a N-terminal fragment (INC). Following control to the fragment N(TW) and a N-terminal fragment called containing the intermediate fragment called containing the intermediate fragment is then notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD) from the membrane (By similarity).

--- FPM: Phosphorylated (By similarity).

--- SIMILARITY: Contains 5 ANK repeats.

--- SIMILARITY: Contains 5 Lin/Notch repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This SWISS-PROT entry is copyright. -!- FUNCTION: Functions as a receptor for membrane-bound ligands Jaggedl, Jaggedl and Deltal to regulate cell-fate determination. Upon ligand activation through the released notch intracellular
                                                                                                                                                                                                                                                               Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RBP-J kappe and activates genes of the enhancer of split locus. Affects the implementation of differentiation, proliferation and apoptotic programs (By similarity).
SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                or send an email to license@isb-sib.ch).

Jagged2 and Deltal to regulate cell-fate determination. Upon ligand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator complex with RBP-J kappa and activates genes of the enhancer of split locus. Affects the implementation of differentiation and apoptotic programs. May play an essential role in postimplantation development, probably in some aspect of cell specification and/or differentiation (By similarity).

J. SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide bonds (By similarity).

J. SUBCELLULAR LOCATION: Type I membrane protein. Following proteclytical processing NICD is translocated to the nucleus.

J. SUBCELLULAR LOCATION: Expressed in postnatal central neurous system (CNS) germinal zones and, in early postnatal life, within numerous cells throughout the CNS. It is more highly localized to be better and choroid and conticular germinal zones. Also found in the heart, liver and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DEVELOPMENTAL STAGE: Expressed in the brain during E14 and E17. PTM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a Cterminal fragment N(TM) and a N-terminal fragment N(EC). Following
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Rattus norvegicus (Rat).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Via its ANK repeats.
SUBCELLULAR LOCATION: Type I membrane protein. Upon activation and the CELELLULAR LOCATION: Type I membrane and enters into the nucleus in conjunction with Su(H).
PTW: Upon binding its ligands such as Delta or Serrate, it is cleaved (S2 cleavage) in its extracellular domain, close to the transmembrane domain. S2 cleavage is probably mediated by Kuz. It is then cleaved (S3 cleavage) downstream of its transmembrane domain, releasing it from the cell membrane. S3 cleavage requires
                                                                                                                                                                                                                                                               MEDLINE-21575956; PubMed=11719214; DOI=10.1016/S0960-9822(01)00562-0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          General outlines of the molecular genetics of the Notch signalling
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                   "Novel Nocch alleles reveal a Deltex-dependent pathway repressing neural fate.";

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DOMAIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DOMAIN
                                                                                                                                                                                                                                                                                    8888888888888888888
    -I- DEVELOPMENTAL STAGE: Highly expressed in endothelial cells during embryonic development from 9.0 dpc.
-I- PTW: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNN-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD) from the membrane.
-I- PTM: Phosphorylated.
-I- DTM: Phosphorylated.
-I- DISEASE: Loss of the extracellular domain causes constitutive activation of the Notch protein, which leads to hyperproliferation of agrandular epithelial tissues and development of mammary
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This SWISS-PROT entry is copyright. C. I- FUNCTION: FUNCTION: FOR membrane-bound ligands as a receptor for membrane-bound ligands and Doilal to regulate coll-fate determination. Upon 11gand activation through the released notch intracellular domain (NICD) it forms a transcriptional activator of split locus.

C. Affects the implementation of differentiation, proliferation and approprie programs (By similarity). May regulate branching morphogenesis in the developing vascular system.

C. I. SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EC) which are probably linked by disulfide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SUBCELLULAR LOCATION: Type I membrane protein. Following proteolytical processing NICD is translocated to the nucleus. TISSUE SPECIFICITY: Highly expressed in lung, moderately in heart kidney, and at lower levels in the ovary and skeletal muscle. A very low expression is seen in the brain, intestine, liver and

terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNF-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called notch extracellular truncation (NEXT). This fragment is then cleaved by presentlin dependent gamma-secretase to release a notch-derived peptide containing the intracellular domain (NICD)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Neurogenic locus notch homolog protein 3. -!- PTM: Phosphorylated.
-! SIMILARITY: Belongs to the NOTCH family.
-!- SIMILARITY: Contains 5 ANK repeats.
-!- SIMILARITY: Contains 34 EGF-like domains.
-!- SIMILARITY: Contains 3 Lin/Notch repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cytoplasmic.

uppression.

Subburg: Heterodimer of a C-terminal fragment N(TW) and a N-terminal fragment N(EC) which are probably linked by disulfide bonds (By similarity).

-I-SUBCULTLUAR LOCATION: Type I membrane protein. Pollowing proteolytical processing NICD is translocated to the nucleus.

-I-TISSUE SPECIFICITY: Expressed in postnatal life, within numerous cells throughout the CNS. It is more highly localized to ventricular germinal zones and, in early postnatal life, within numerous cells throughout the CNS. It is more highly localized to ventricular germinal zones.

-I-PM: Synthesized in the endoplasmic reticulum as an inactive form which is proteolytically cleaved by a furin-like convertase in the trans-Golgi network before it reaches the plasma membrane to yield an active, ligand-accessible form. Cleavage results in a C-terminal fragment N(TM) and a N-terminal fragment N(EC). Following ligand binding, it is cleaved by TNR-alpha converting enzyme (TACE) to yield a membrane-associated intermediate fragment called (TACE)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MEDLINE=21094508; Pubmed=11182080; DOI=10.1016/S0896-6273(01)00179-9;

notch-derived peptide containing the intracellular domain (NICD) from the membrane (By similarity).
PTM: Phosphorylated (By similarity).
SIMILARITY: Belongs to the NOTCH family.
SIMILARITY: Contains 5 ANK repeats.
SIMILARITY: Contains 34 EGF-like domains.
SIMILARITY: Contains 3 Lin/Notch repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Neurogenic locus notch homolog protein 3.

Gray G.E., Mann R.S., Mitsiadis E., Henrique D., Carcangiu M.-L.,
Barks A., Leinan J., Ward D., Ish-Horowitz D., Artavanis-Tsakonas S.;
T. Human ligands of the Notch receptor.";
Am. J. Pathol. 154:785-794(1999).
C. - FUNCTION: Functions as a receptor for membrane-bound ligands
C. - Gomain (NICD) it forms a transfort cell-fate determination.
C. Upon ligand activation through the released notch intracellular
C. Gomain (NICD) it forms a transfortpitional activator complex with
RBF-J kappa and activates genes of the enhancer of split locus.
C. Affects the implementation of differentiation, proliferation and apoptotic programs. May regulate branching morphogenesis in the developing vascular system (By similarity).
C. SUBUNIT: Heterodimer of a C-terminal fragment N(TM) and a N-terminal fragment N(EM) which are probably linked by disulfide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Isoid=Q99466-3; Sequence=VSP 001407;
TISSUE SPECIFICITY: Highly expressed in the heart, moderately in
the lung and placenta and at low levels in the liver, skeletal
muscle, kidney, pancreas, spleen, lymph node, thymus, bone marrow
and fetal liver. No expression was seen in adult brain or
peripheral blood leukocytes.
                                                                                                                                                                                                                                                                                                                                                   TISSUE=Placenta;

                                                                                                  through subsequent stages.

MISCELLANEOUS: Expressed both maternally and zygotically.
SIMILANITY: Contains 1 avidin domain.
SIMILANITY: Contains 1 CUB domain.
SIMILANITY: Contains 8 EGF-like domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 calcium-binding (

                                                                            -!-DISEASE: A truncating mutation in Dl13 is the cause of the pudgy (pu) phenotype. Pudgy mice exhibit patterning defects at the earliest stages of somitogenesis. Adult pudgy mice present severe vertebral and rib deformities.
-!-SIMILARITY: Contains 1 DSL domain.
-!-SIMILARITY: Contains 6 EGF-like domains.
      TISSUE SPECIFICITY: Predominantly expressed in the neuroectoderm
                                                                                                                                                                                                                                                                                                                                                                                                                                              REMBL; ALBOS; LAMA33716.1; -.
